

**The cost-effective way to get consistently good labeling results with water based adhesives.**

**Action :** Any number of labels, up to approx. 500, are inserted in a pile into the magazin and each label is then fed automatically through a rubber roller to the glueing roller. Here it is evenly coated with a film of glue, which can be adjusted in thickness, and slides on to the "fingers", where it is grasped and then adhered to the packaging. The speed can be adjusted from between 2 and approx. 60 labels per minute (depending on the size).  
The device is also equipped with an additional mechanism for single label delivery. With the glueing roller rotating continuously, a slight touch of the release switch will cause a glued label to be dispensed. In this case, it is the operator who determines the speed. This is recommended for labels which require more time or care in application than usual.

**Output:** The machine will deliver 500 - 700 labels per hour, depending on the size of label and the set speed.

**Cleaning :** Just put the second tray filled with water in the place of the glue tray, and the gumming roller is automatically washed .

**Motordrive :** adjustable 230 V. or 110 V.AC gearmotor
